Zadanie 2–2

Patryk Lisik

12 Grudnia 2023

Treść

Pokaż, że dla niesymetrycznego kanały binarnego z rysunku 1, gdzie

$$Pr(X = 0) = x$$
 $Pr(X = 1) = 1 - x$

oraz

$$\Pr(Y = 0|X = 0) = 1 - p$$
 $\Pr(Y = 1|X = 0) = p$ $\Pr(Y = 0|X = 1) = q$ $\Pr(Y = 1|X = 1) = 1 - q$

informacja wzajemna dana jest wzorem

$$I(X;Y) = \Omega((1-p)x + q(1-x)) - x\Omega(p) - (1-x)\Omega(q)$$

gdzie

$$\Omega(x) = -x \log_2 x - (1-x) \log_2 (1-x)$$

Rozwiązanie

$$I(X;Y) = H(Y) - H(Y|X)$$

$$q_0 = x(1-p) + (1-x)q$$

$$q_1 = (1-x)(1-q) + xp = 1 - x + px - q - xq$$

$$H(Y) = -\sum_j q_j \log_2 q_j = -q_0 \log_2 q_0 - q_1 \log_2 q_1$$

$$= x(1-p) + q(1-x) \log_2(x(1-p) + q(1-x)) - (1-x+px-q-xq) \log_2(1-x+px-q-xq)$$

$$= \Omega((1-p)x + q(1-x))$$

$$H(Y|X) = \sum_{i} p_{1}H(Y|x_{1}) = p_{0}H(Y|x_{0}) + p_{1}H(Y|x_{1})$$

$$p_{0}H(Y|x_{0}) = x \left(\sum_{i} \Pr(y_{1}|x_{0}) \log_{2} \Pr(y_{1}|x_{0})\right)$$

$$= x(\Pr(y_{0}|x_{0}) \log_{2} \Pr(y_{0}|x_{0}) + \Pr(y_{1}|x_{0}) \log_{2} \Pr(y_{1}|x_{0}))$$

$$= x\Omega(p)$$

$$p_1 H(Y|x_1) = (1-x) \left(\sum_i \Pr(y_i|x_1) \log_2 \Pr(y_i|x_1) \right)$$
$$(1-x) (\Pr(y_0|x_1) \log_2 \Pr(y_0|x_1) + \Pr(y_1|x_1) \log_2 \Pr(y_1|x_1))$$
$$= (1-x)\Omega(q)$$
